

## **1.What is the use of SQLite open helper class in SQLite?**

A helper class allows database management ,  
creation and version management.

this is the class where we will create all the tables, and upgrade tables.

## **2.What is the use of OnUpgrade function in SQLiteOpenHelper class?**

The constructor of your implementation of SQLiteOpenHelper should call the  
super constructor,

passing along the database name and version.

The onUpgrade() method will only be called when the version integer is larger  
than the current version running in the emulator.

If you want the onUpgrade() method to be called,  
you need to increment the version number in your code.

## **3. How to show SQLite database table information in Android application what is the best way to do it?**

Use table layout with cursor

showing data base information will be better suited with table layout.

since table layout is not an adapter view, you can't use cursor adapter with it.

So use table layout with cursor to show data base table information.
